Charlotte Sève & Stéphanie Mahévas

Importance of spatial in conservation ecology

Space in ecology

- Space influence ecological patterns and processes:
 - resource availability
 - displacement
 - Interactions
- Most often **non-uniform** distribution
- Among species and for age/length groups

Space in conservation

- Main goal: **protect biodiversity**
- Other spatial dimensions
 - Ecosystem services
 - Human uses
 - Abiotic factors
- Facilitate effective **prioritization** of areas for conservation
- Help finding **trade-off**
- Guidance for mitigating effects of environmental changes

Ecological responses

Environmental covariates

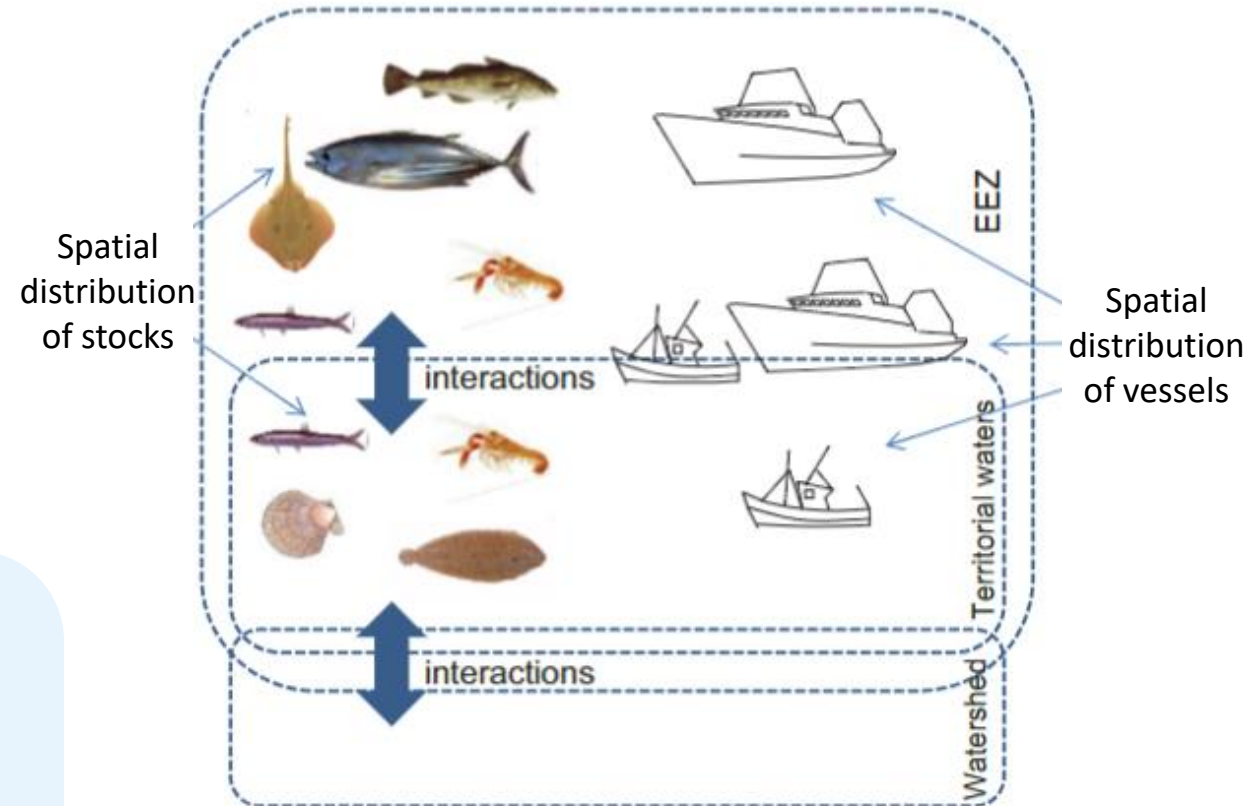

Importance of spatial in fisheries management

A complexe activity

- **Most stocks** subjected to fishing → **spatial heterogeneity**
- **Mixed fisheries**
 - complex interactions between species and fleet
 - at various spatial scales
- **Spatial overlaps**
 - between population, métier and management zones
 - It determine fishing effort allocation

A complexe management strategy

- Different spatial scales
(ecological, economic, legal and institutional zones)
- Institutional frameworks are informed by **spatial dynamics** for effective management
- **Spatial delimitation** in fisheries management (quotas, TURF)
- Influence of the creation of MPAs or human activities (OWF)

From Le Floc'h et al. (2018), *Aquat. Living Resour.*

Increasing spatial complexity in patch models

Non-spatial

- **No spatial distribution, movement of organisms, ecological processes**
- Focus on the dynamics and interactions of populations
 - Example: Impact of MPAs on yields?
 - optimization model
 - no spatial distribution, density dependent growth
 - MPAs can produce similar maximal yields than managed harvest

Hastings & Botsford (1999), Science

Spatial

Spatially implicit models

- Several patches representing spatial aspects
- **Ignore spatial arrangement** of patches
 - Example: test of protecting source or sink locations
 - More effective to protect sources
- Limits: pop with spatial distribution, movements
 - + exploitation features with non-uniform space distribution

Spatially explicit models

- **Geo-referenced patches** with associate information
- Account for movement patterns
- Test MPA location, reserve size, shape, fishing effort distribution

Sanchirico & Wilen (2001), Jour. Env. Eco. And Manag.

A spatially explicit demographic model : ISIS-fish

- **Spatially explicit** (grid)
- Multi-species
- **Multi-fleet**
- Mixed fisheries
- **Migration**
- Spatial overlaps

Three case study with different spatial approaches

1

Restoration of nursery habitat in Bay of Toulon

2

Multi-levels MPA networks in Golfe du Lion MP

3

Restoration of nursery habitat and other management strategy in Marseille

What are the possible impacts of increasing spatial complexity ?

How to define a modelling strategy?

Question

- Objectives
- Indicators
- Ambition

Processes

- **List of needs**
- Species
- Fleet
- Processes

Data

- Which data are available?
- Their resolution
- For each group

Modelling strategy

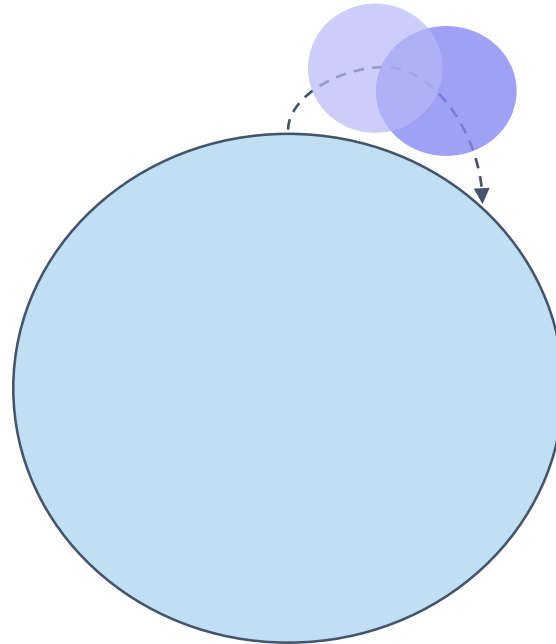

- Model choice
- Spatial complexity
- Coherence of scales
- Group dynamics, processes
- Overlaps between groups

First case study

1

Restauration of nursery habitat in Bay of Toulon

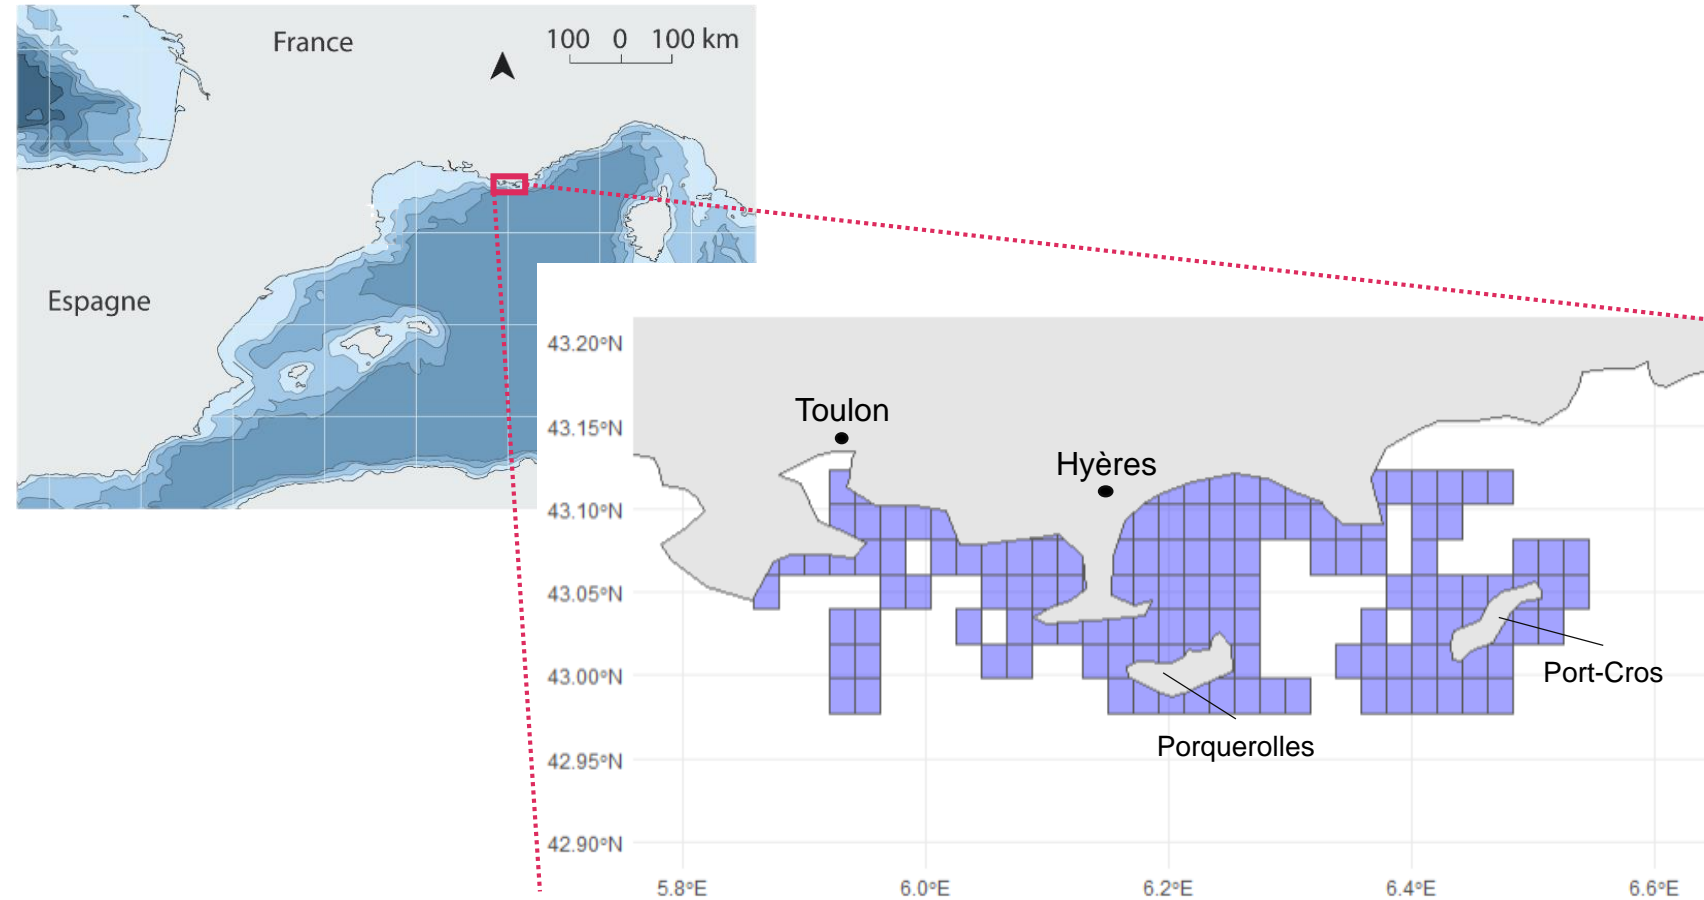

Restauration of nursery habitats in Bay of Toulon

Question

- What impact does the installation of **artificial nurseries** have on adult fish **populations**?
- How effective are they compared with other management measures?

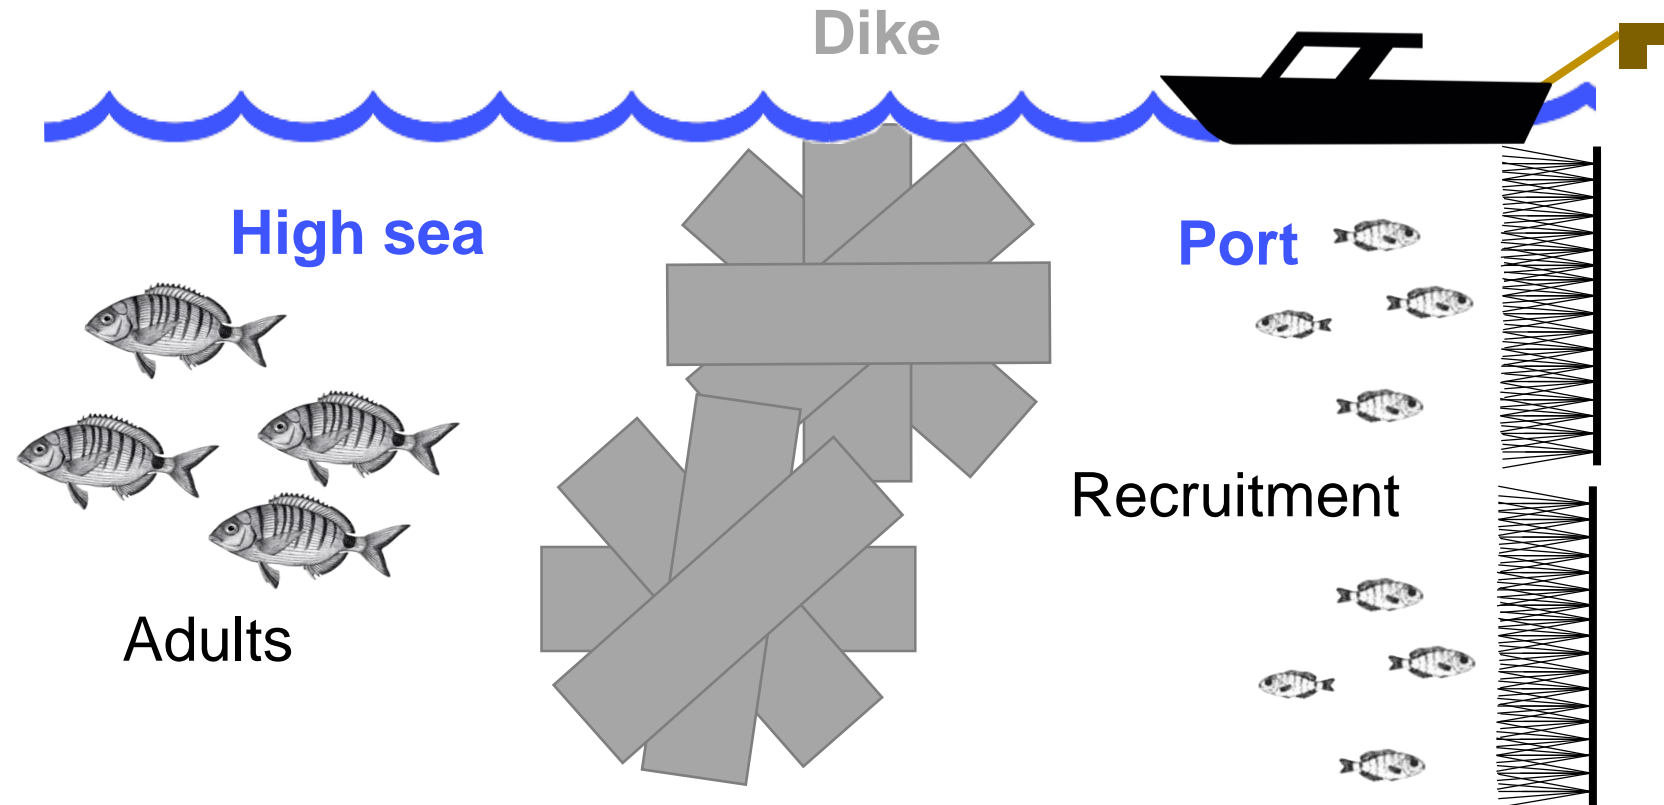

Restauration of nursery habitats in Bay of Toulon

Question

- What impact does the installation of **artificial nurseries** have on adult fish **populations**?
- How effective are they compared with other management measures?

Restauration of nursery habitats in Bay of Toulon

Question

- What impact does the installation of **artificial nurseries** have on adult fish **populations**?
- How effective are they compared with other management measures?

Processes

- Population dynamic (reproduction, recruitment...)
- Fishing mortality
- Spatial component

Data

- No data about abundance at fine scale (restauration modules ~ 200m)
- Use a spatially implicit modeling strategy

Implicit spatial

Restauration of nursery habitats in Bay of Toulon

Strategy

- Population dynamic
- Spatially implicit nursery area

Adult area

14 age group

Natural mortality (26%)

Fishing effort

- Professional fishing
- Recreational fishing

Reproduction

Eggs

Eclosion

Larvae

Mortality (99%)

Benthic installation
10 ind/m

Nursery area

Natural (~ 56 km)

Mortality (80%)

Port (~ 25 km)

Mortality (99%)

Restauration of nursery habitats in Bay of Toulon

Strategy

- Population dynamic
- Spatially implicit nursery area
- Hyp: restaured port area mortality = natural area mortality

Adult area

14 age group

Natural mortality (26%)

Fishing effort

- Professional fishing
- Recreational fishing

Scenario 1

Restauration of **10%**
of port linear (6km)

Scenario 2

Restauration of **100%**
of port linear (60km)

Restaured port linear

Mortality (80%)

Scenario 3

No illegal fishing (no
individual <23cm caught)

Scenario 4

Scenario 2 + 3

Nursery area

Natural (~ 56 km)

Mortality (80%)

Port (~ 25 km)

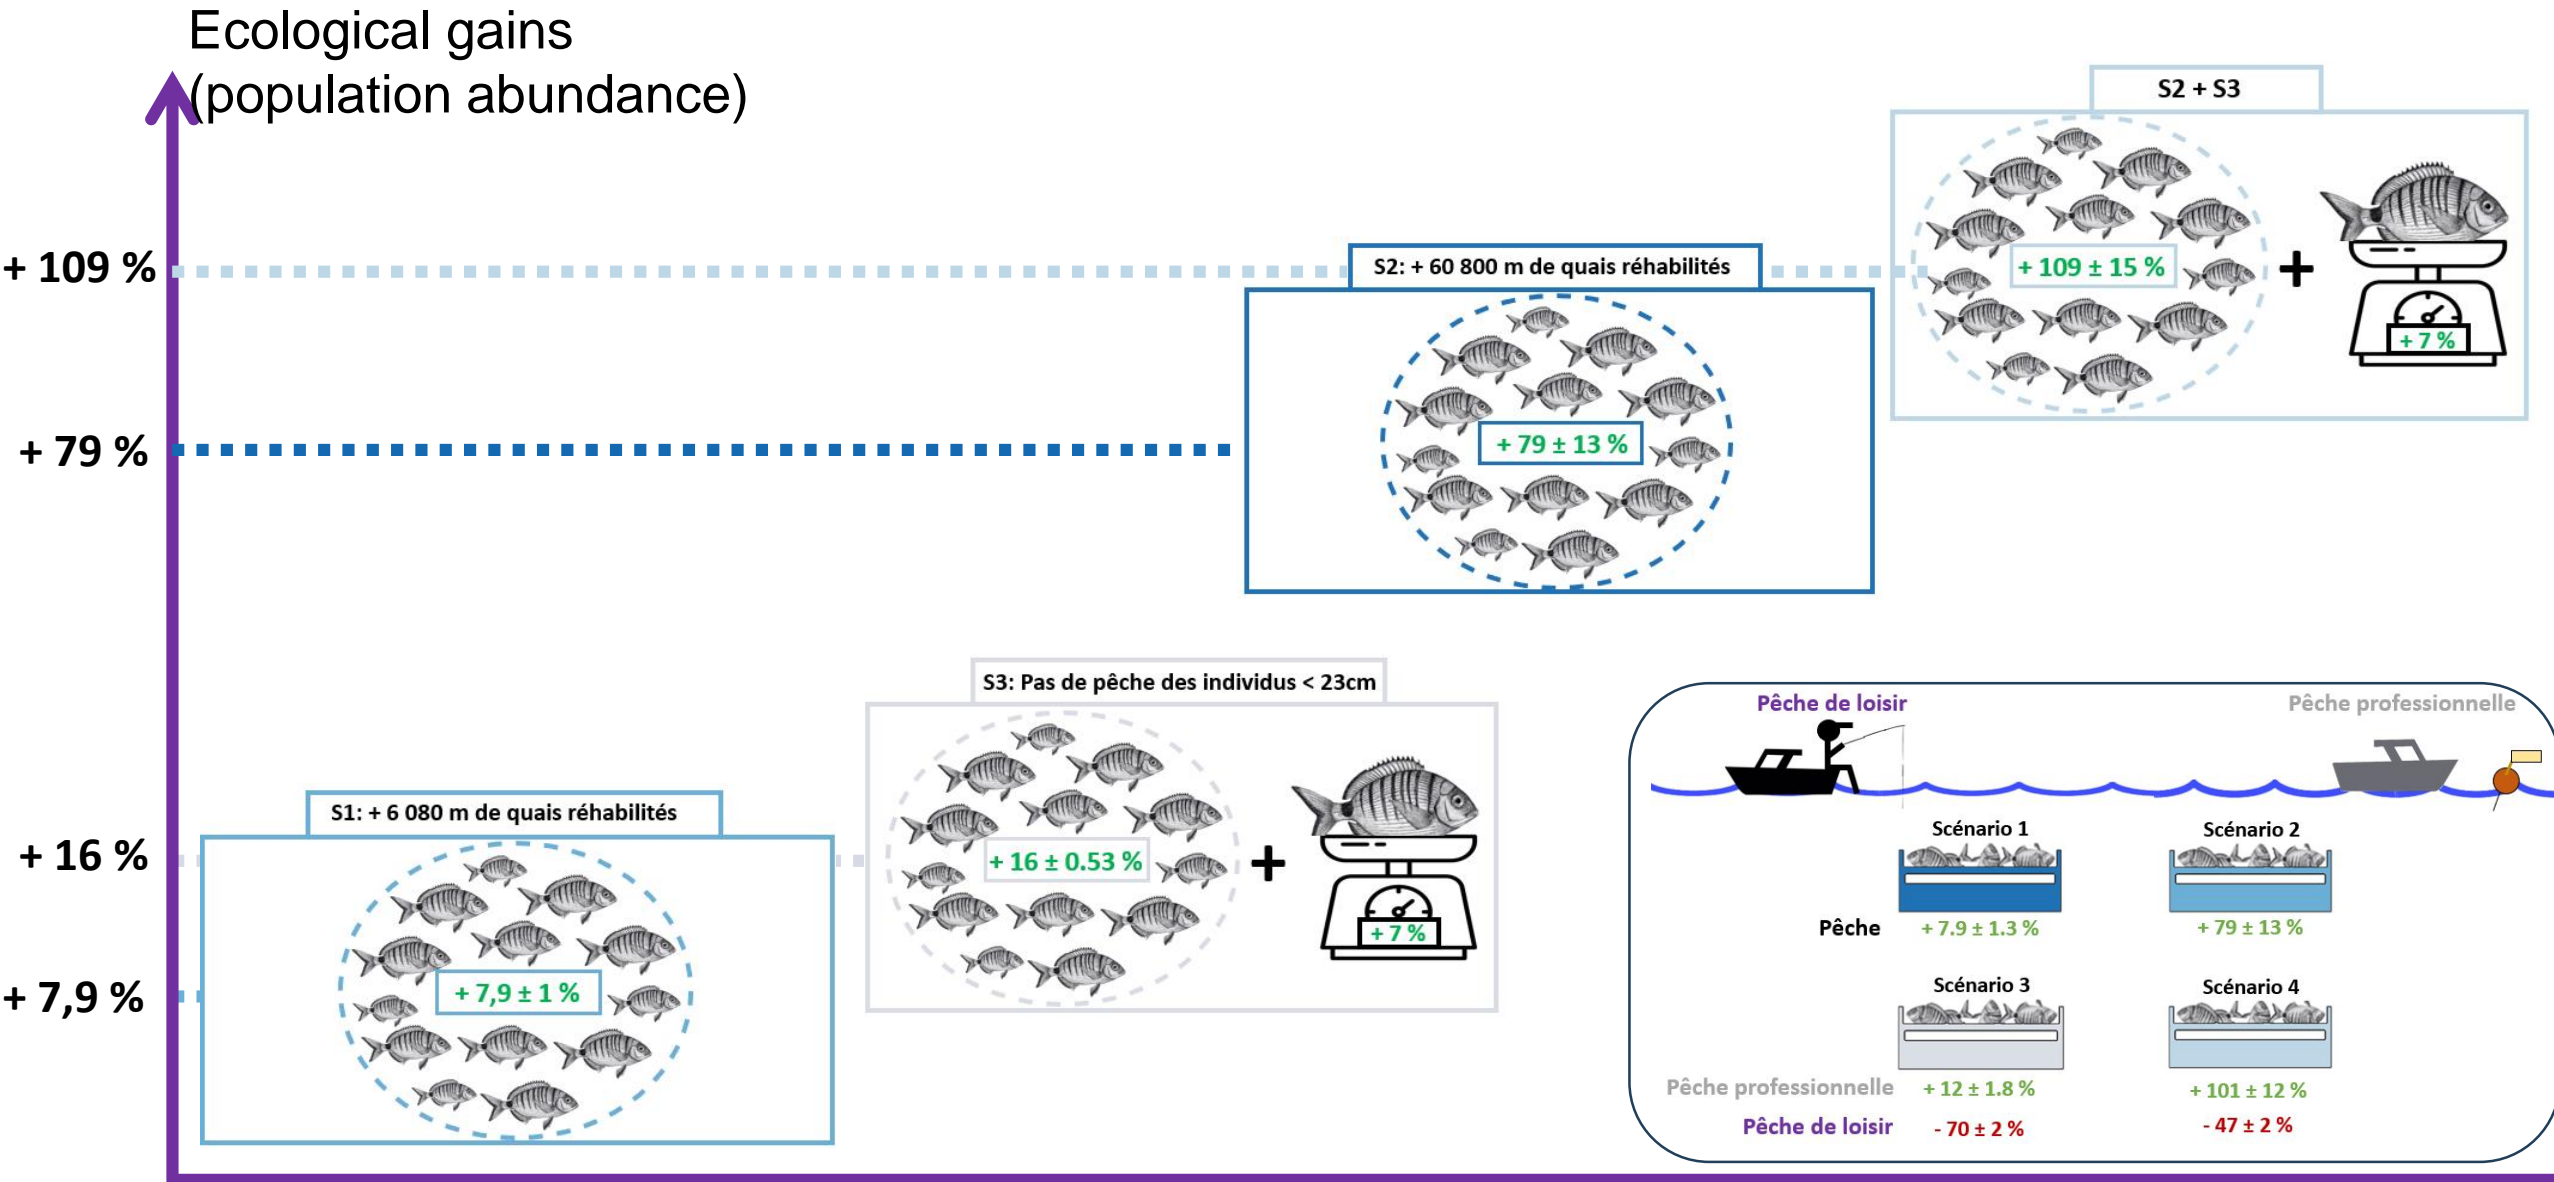

Mortality (99%)

Restaured

Mortality (80%)

Restauration of nursery habitats in Bay of Toulon

Limits

1 Restoration of nursery habitat in Bay of Toulon

- **Uniform** adult and juvenil **distribution**
- **Uniform fishing activity**
- **No larval dispersal** representation
- General results to be taken with caution

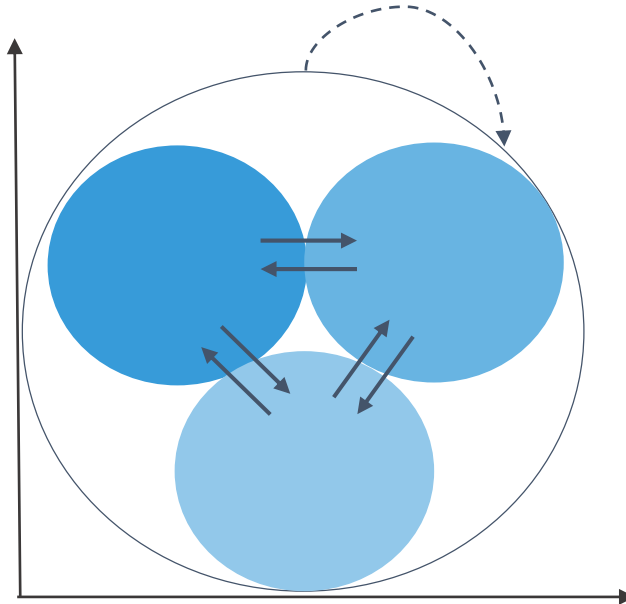

Second case study

2

Multi-levels MPA networks in Golfe du Lion MP

Multi-levels MPA networks in Golfe du Lion MP

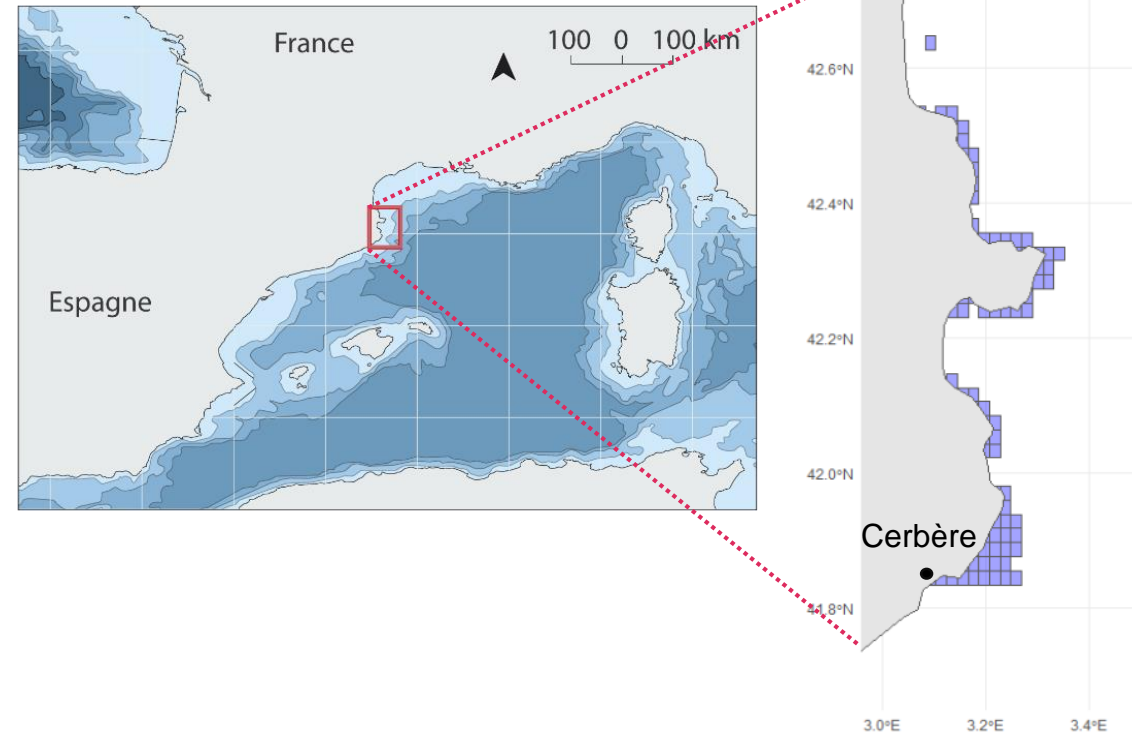

Question

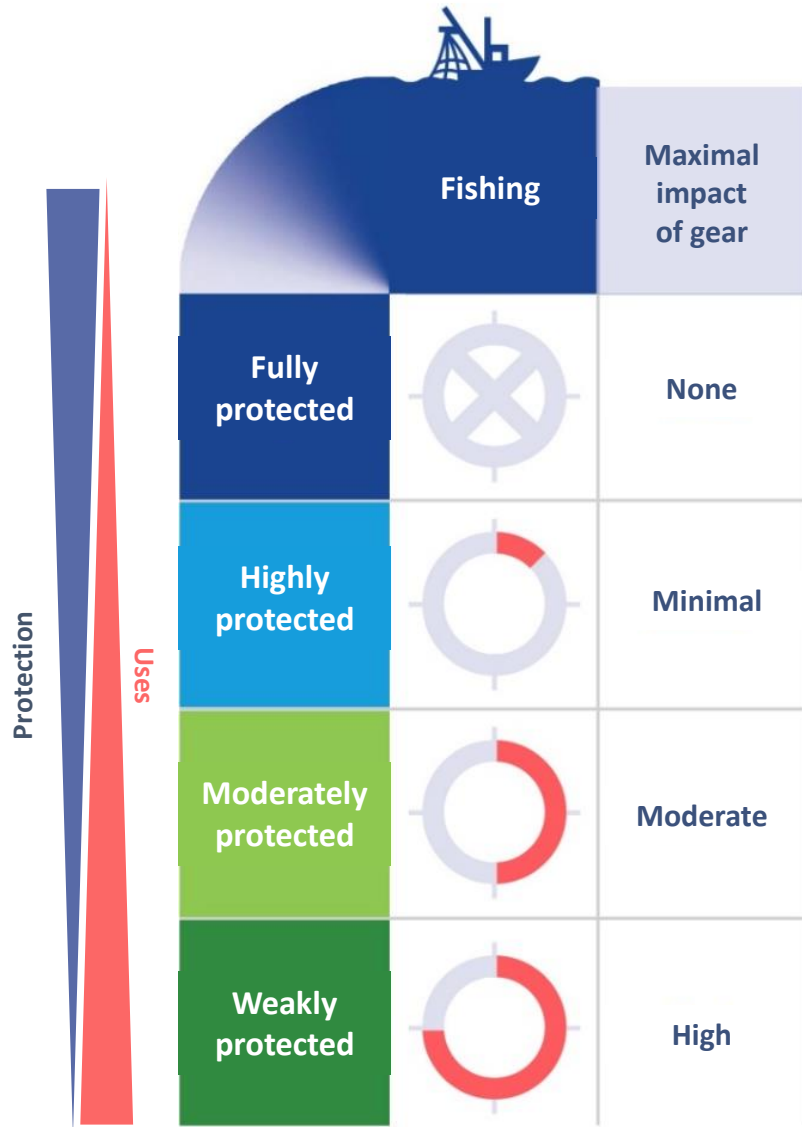

- What are the ecological and fisheries impact of implementing **MPA networks with various levels of protection**?
- What is the **impact on specific gear types**?

Where? Golfe du Lion marine park

Multi-levels MPA networks in Golfe du Lion MP

Question

- What are the ecological and fisheries impact of implementing **MPA networks with various levels of protection**?
- What is the **impact on specific gear types**?

Processes

- Population dynamic
- **Multi-fleet** fisheries
- **Larval dispersal**
- Spatially explicit

Data

- Connectivity matrix for a resolution 2x2km
→ *Influence our resolution choice*
- No data data on spatial allocation of fishing effort
→ *Homogeneous fishing effort (hypothesis)*

Strategy

- Adult areas and spatial variability of abundance
- Fishing effort associated with each metier

Adult area

14 age group

Natural mortality (26%)

Fishing effort

- Professional fishing
- Recreational fishing

Variable abundance

Reproduction

Eggs

Eclosion

Larvae

Mortality (99%)

Dispersal
Connectivity
matrix

Nursery area

Strategy

- Adult areas and spatial variability of abundance
- Fishing effort associated with each metier
- MPAs and fishing effort displacement

Multi-levels MPA networks in Golfe du Lion MP

Strategy

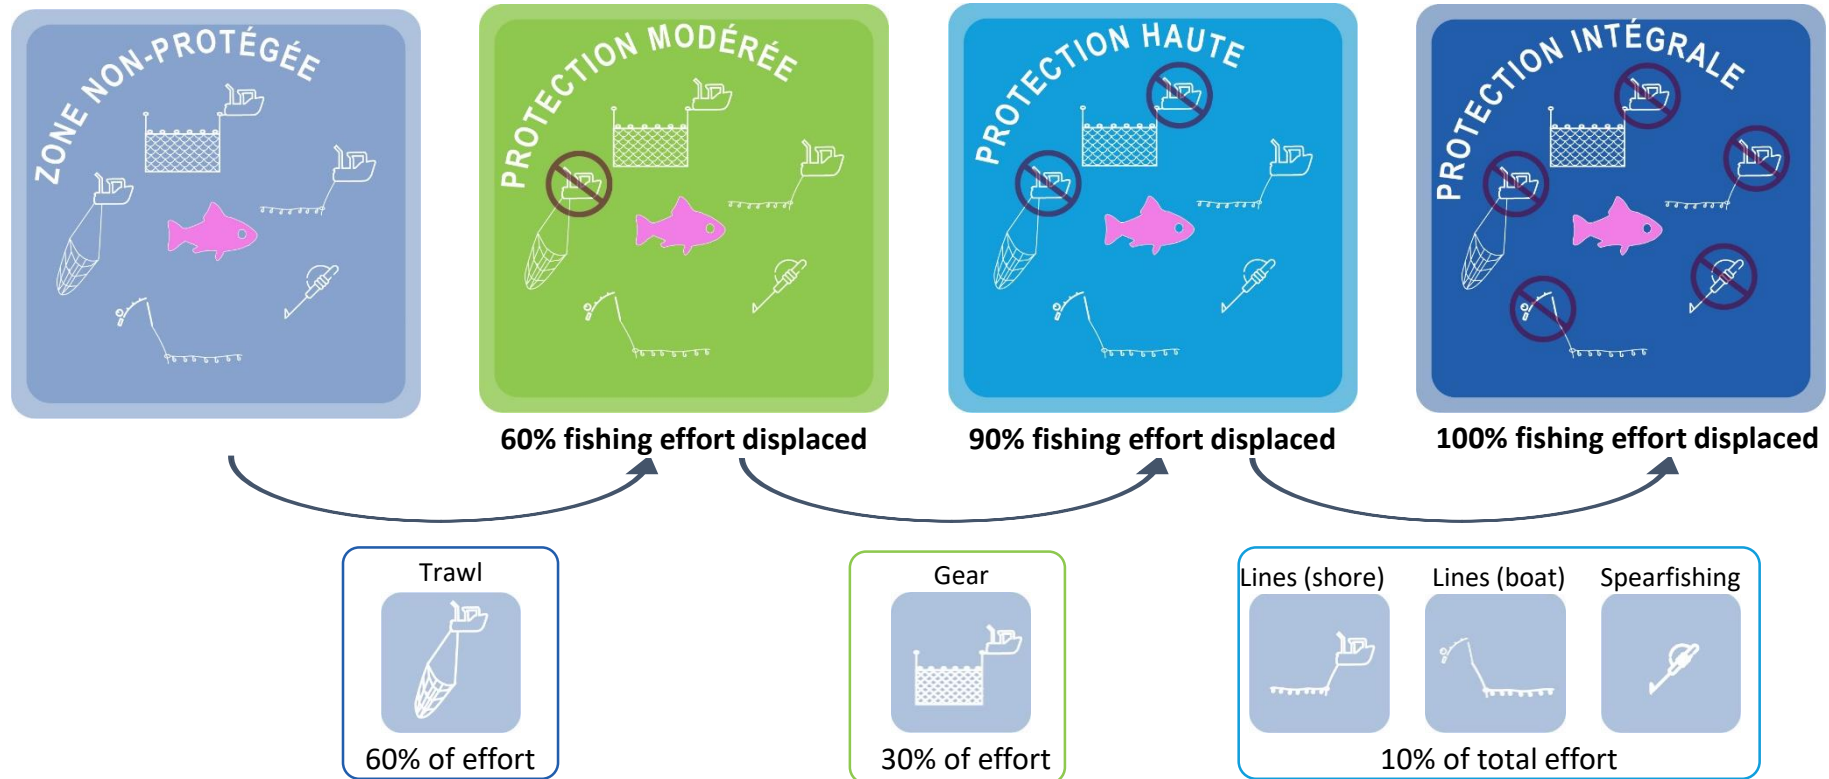

- Adult areas and spatial variability of abundance
- Fishing effort associated with each metier
- MPAs and fishing effort displacement

Multi-levels MPA networks in Golfe du Lion MP

Strategy

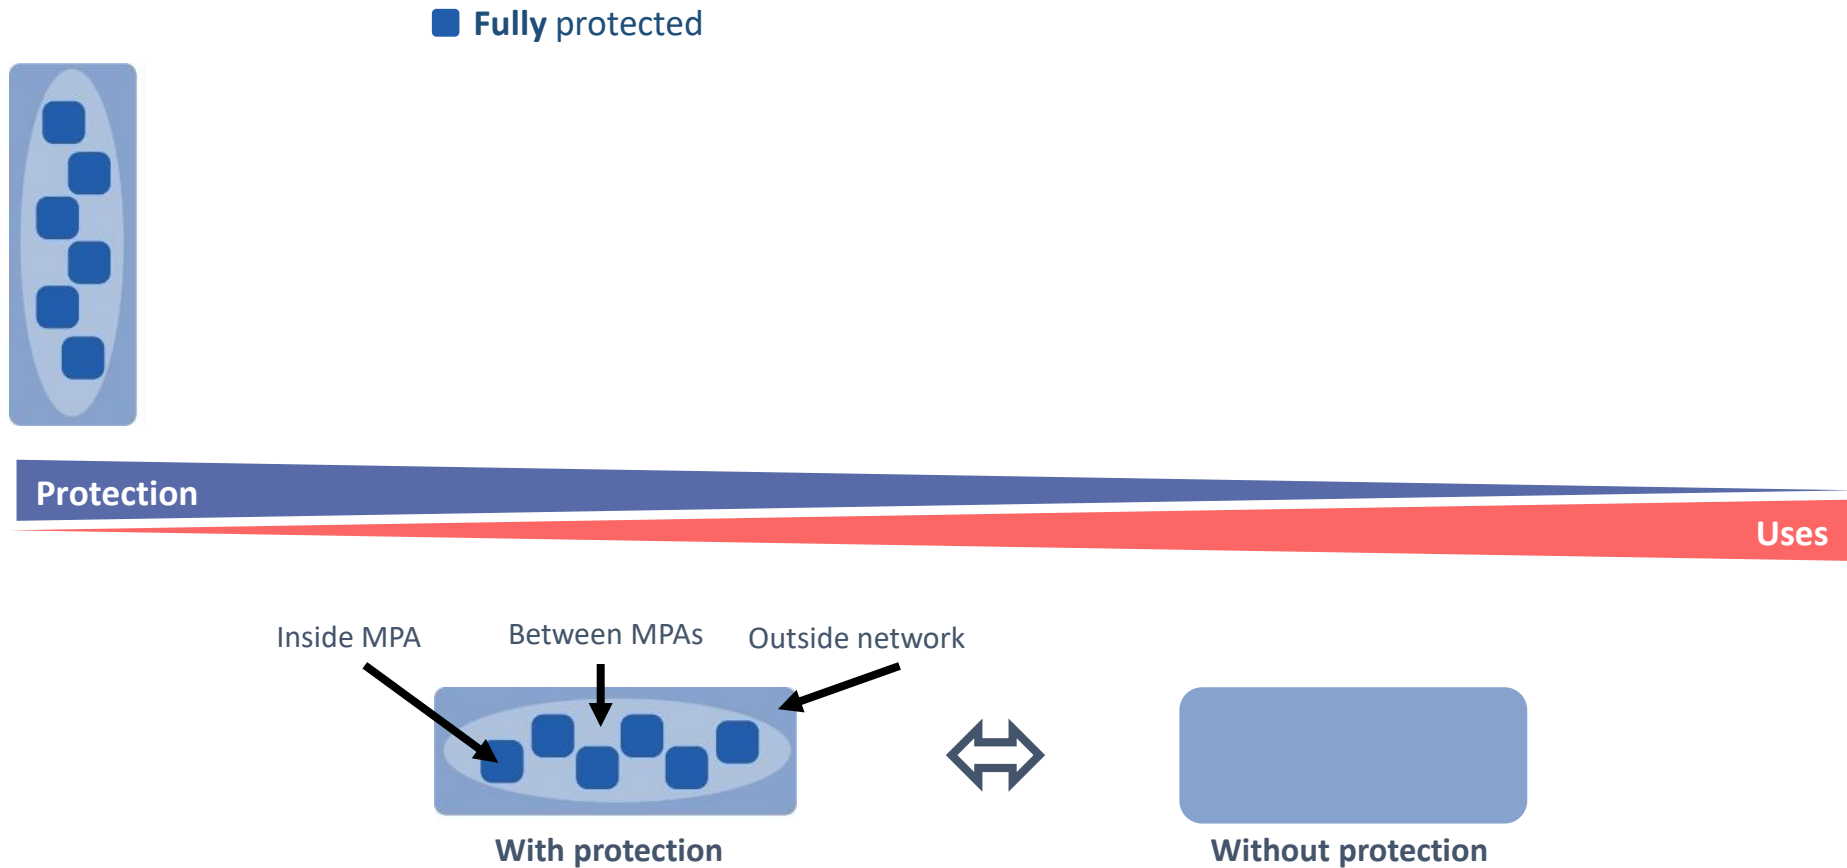

- Adult areas and spatial variability of abundance
- Fishing effort associated with each metier
- MPAs and fishing effort displacement
- Levels of protection

Multi-levels MPA networks in Golfe du Lion MP

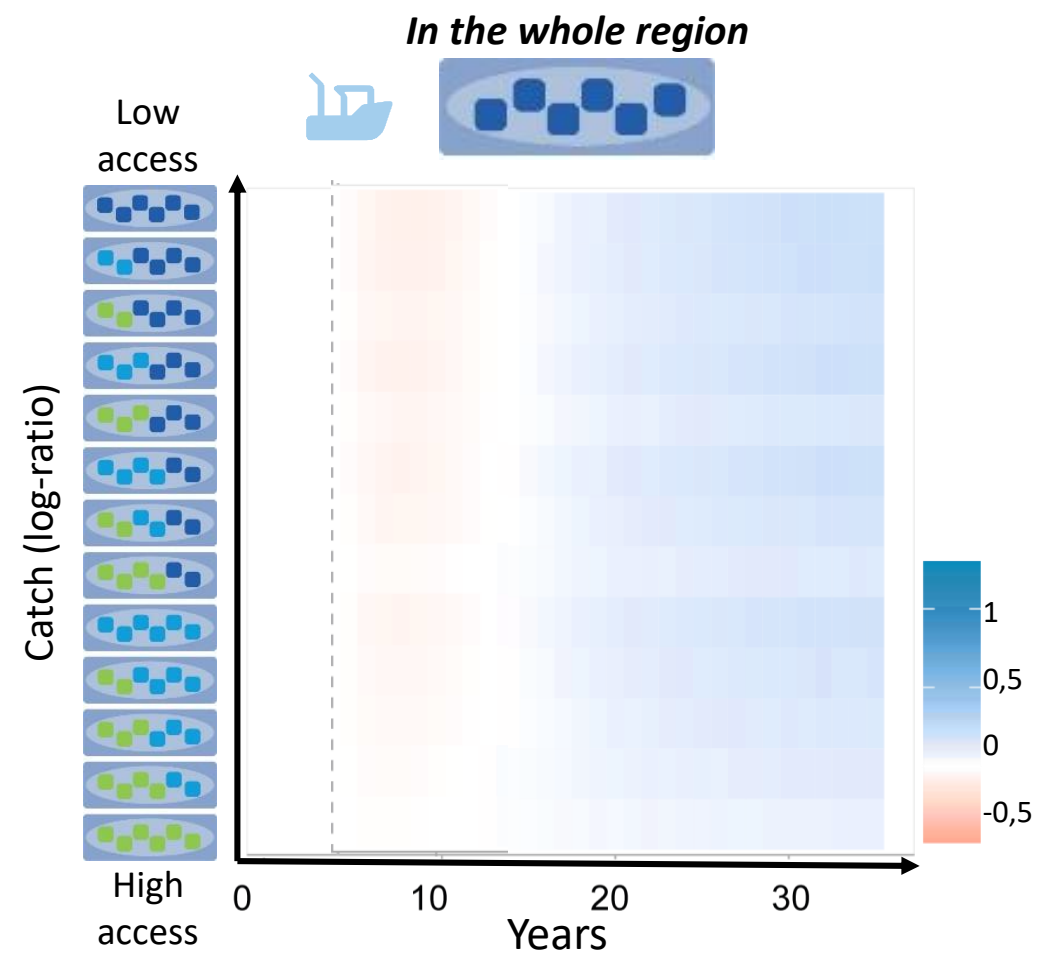

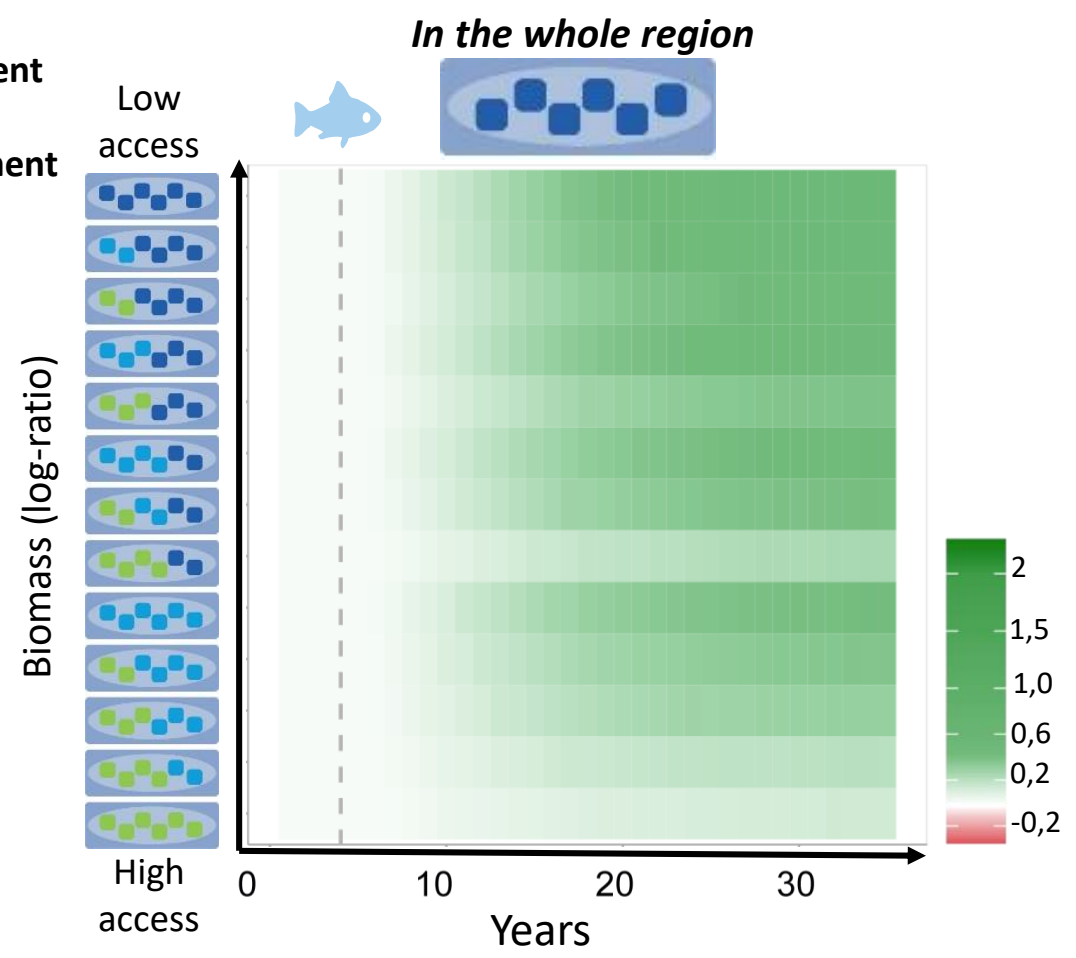

Strategy

- Adult areas and spatial variability of abundance
- Fishing effort associated with each metier
- MPAs and fishing effort displacement
- Levels of protection
- Management scenarios

Multi-levels MPA networks in Golfe du Lion MP

Management vs. \emptyset management

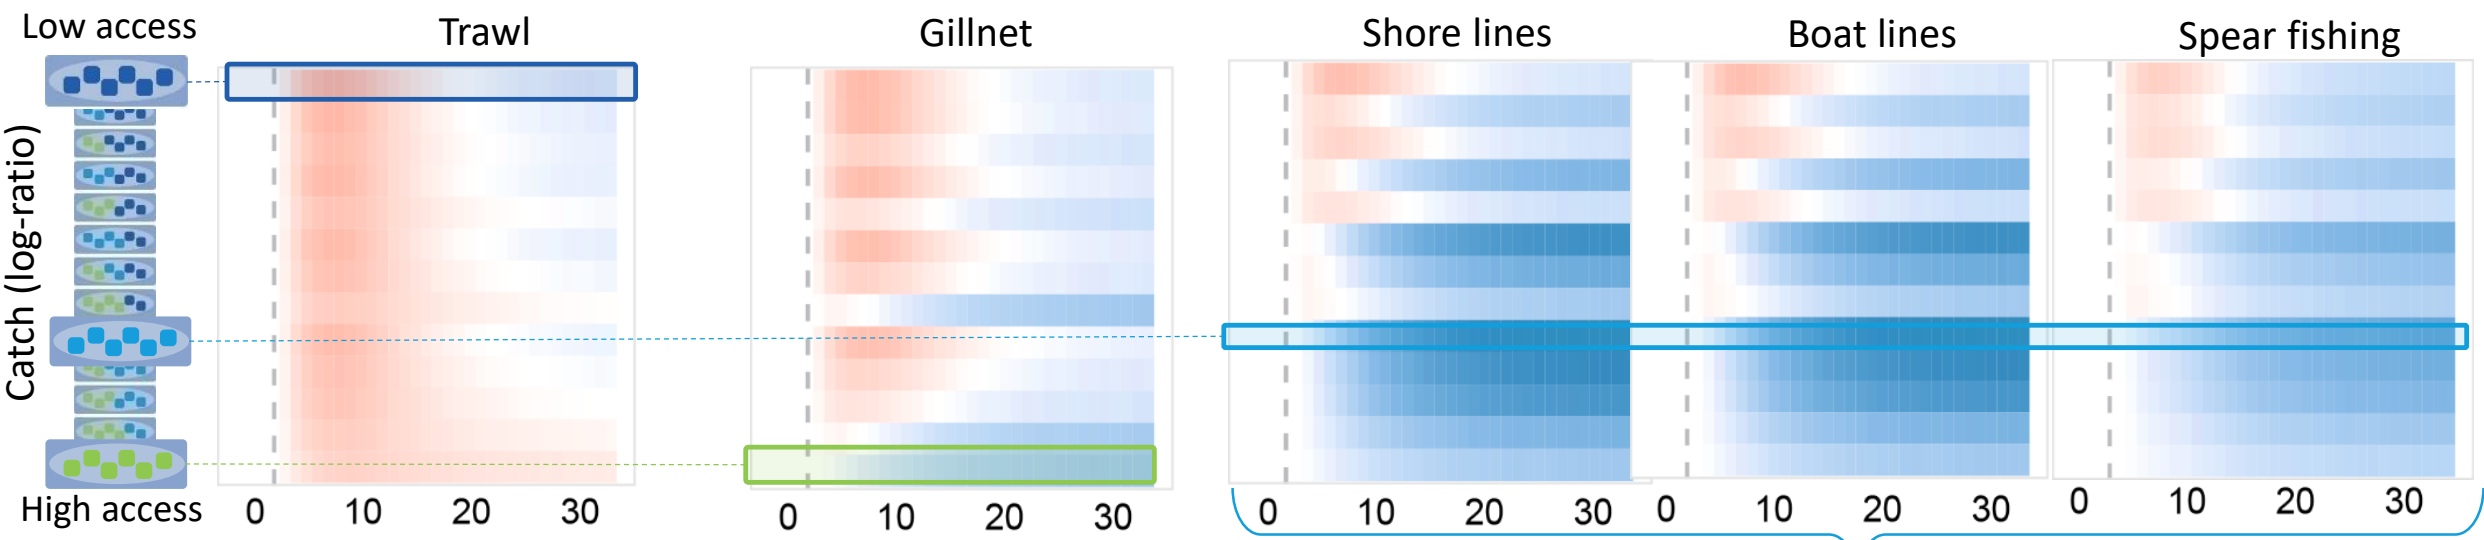

Maximum gains are long term with full and high protection
Catch losses in the short term and gains in the long term

Multi-levels MPA networks in Golfe du Lion MP

Management vs. ∅ management

The impact of protection differ with métiers

2

Multi-levels MPA networks in Golfe du Lion MP

- Uniform fishing activity
(but reallocation of fishing effort)
- Mono-species case study
- Futur development of endogeneous
fishing behaviour / bio-economic model

Third case study

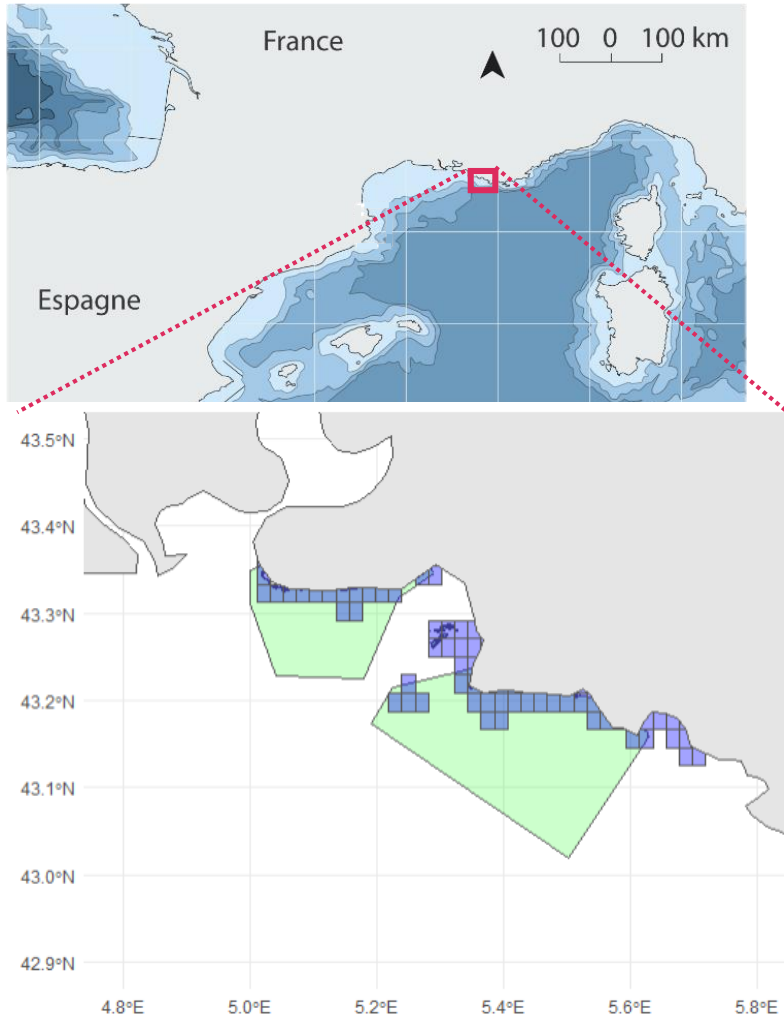

3 Restoration of nursery habitat and other management strategy in Marseille

Restauration and management in Marseille

Where? Marseille

Question

- Can we describe **more precisely** the impact of **restauration** process?
- What are the impacts on population **compared to other management measures at larger scale?**

Processes

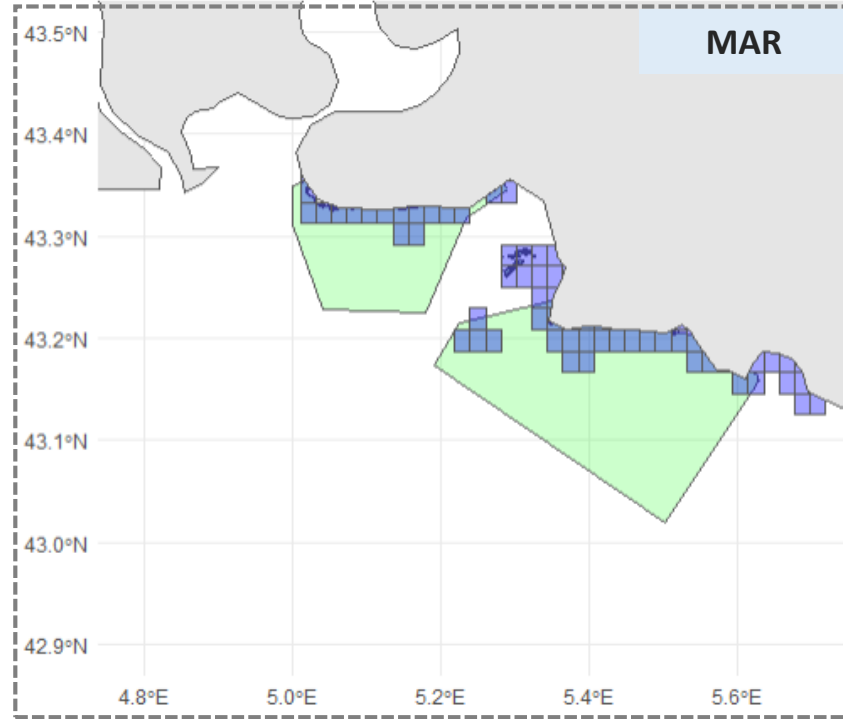

- Possibility to compare with Golfe du Lion MP model
- Larval connectivity in Marseille
- Adult and larval spatial abundance

Data

- Connectivity data at the NWM scale
- Model testing multi-level MPAs in Golfe du Lion

**Do we need a new, bigger model, including Marseille and Banyuls?
i.e. Can the two zones be considered independent?**

Restauration and management in Marseille

Strategy

- Determine spatial scale

  2 sub-models

 1 larger model

→ Need to study the connectivity of the region

Strategy

- Determine spatial scale

Lagrangian model → Study larval connectivity in the area

Restauration and management in Marseille

Strategy

- Determine spatial scale
 - Langrangian model
 - Indicator calculation

Flux

Importation

Exportation

Local production

Number of particle
arrived into the area

$$Imp = \frac{\sum_{i \in Z_M} A_i}{\sum_{i=1}^N A_i}$$

Number of particle
arrived anywhere

Number of particle
produced in the area

$$Exp = \frac{\sum_{i \in Z_M} D_i}{\sum_{i=1}^N D_i}$$

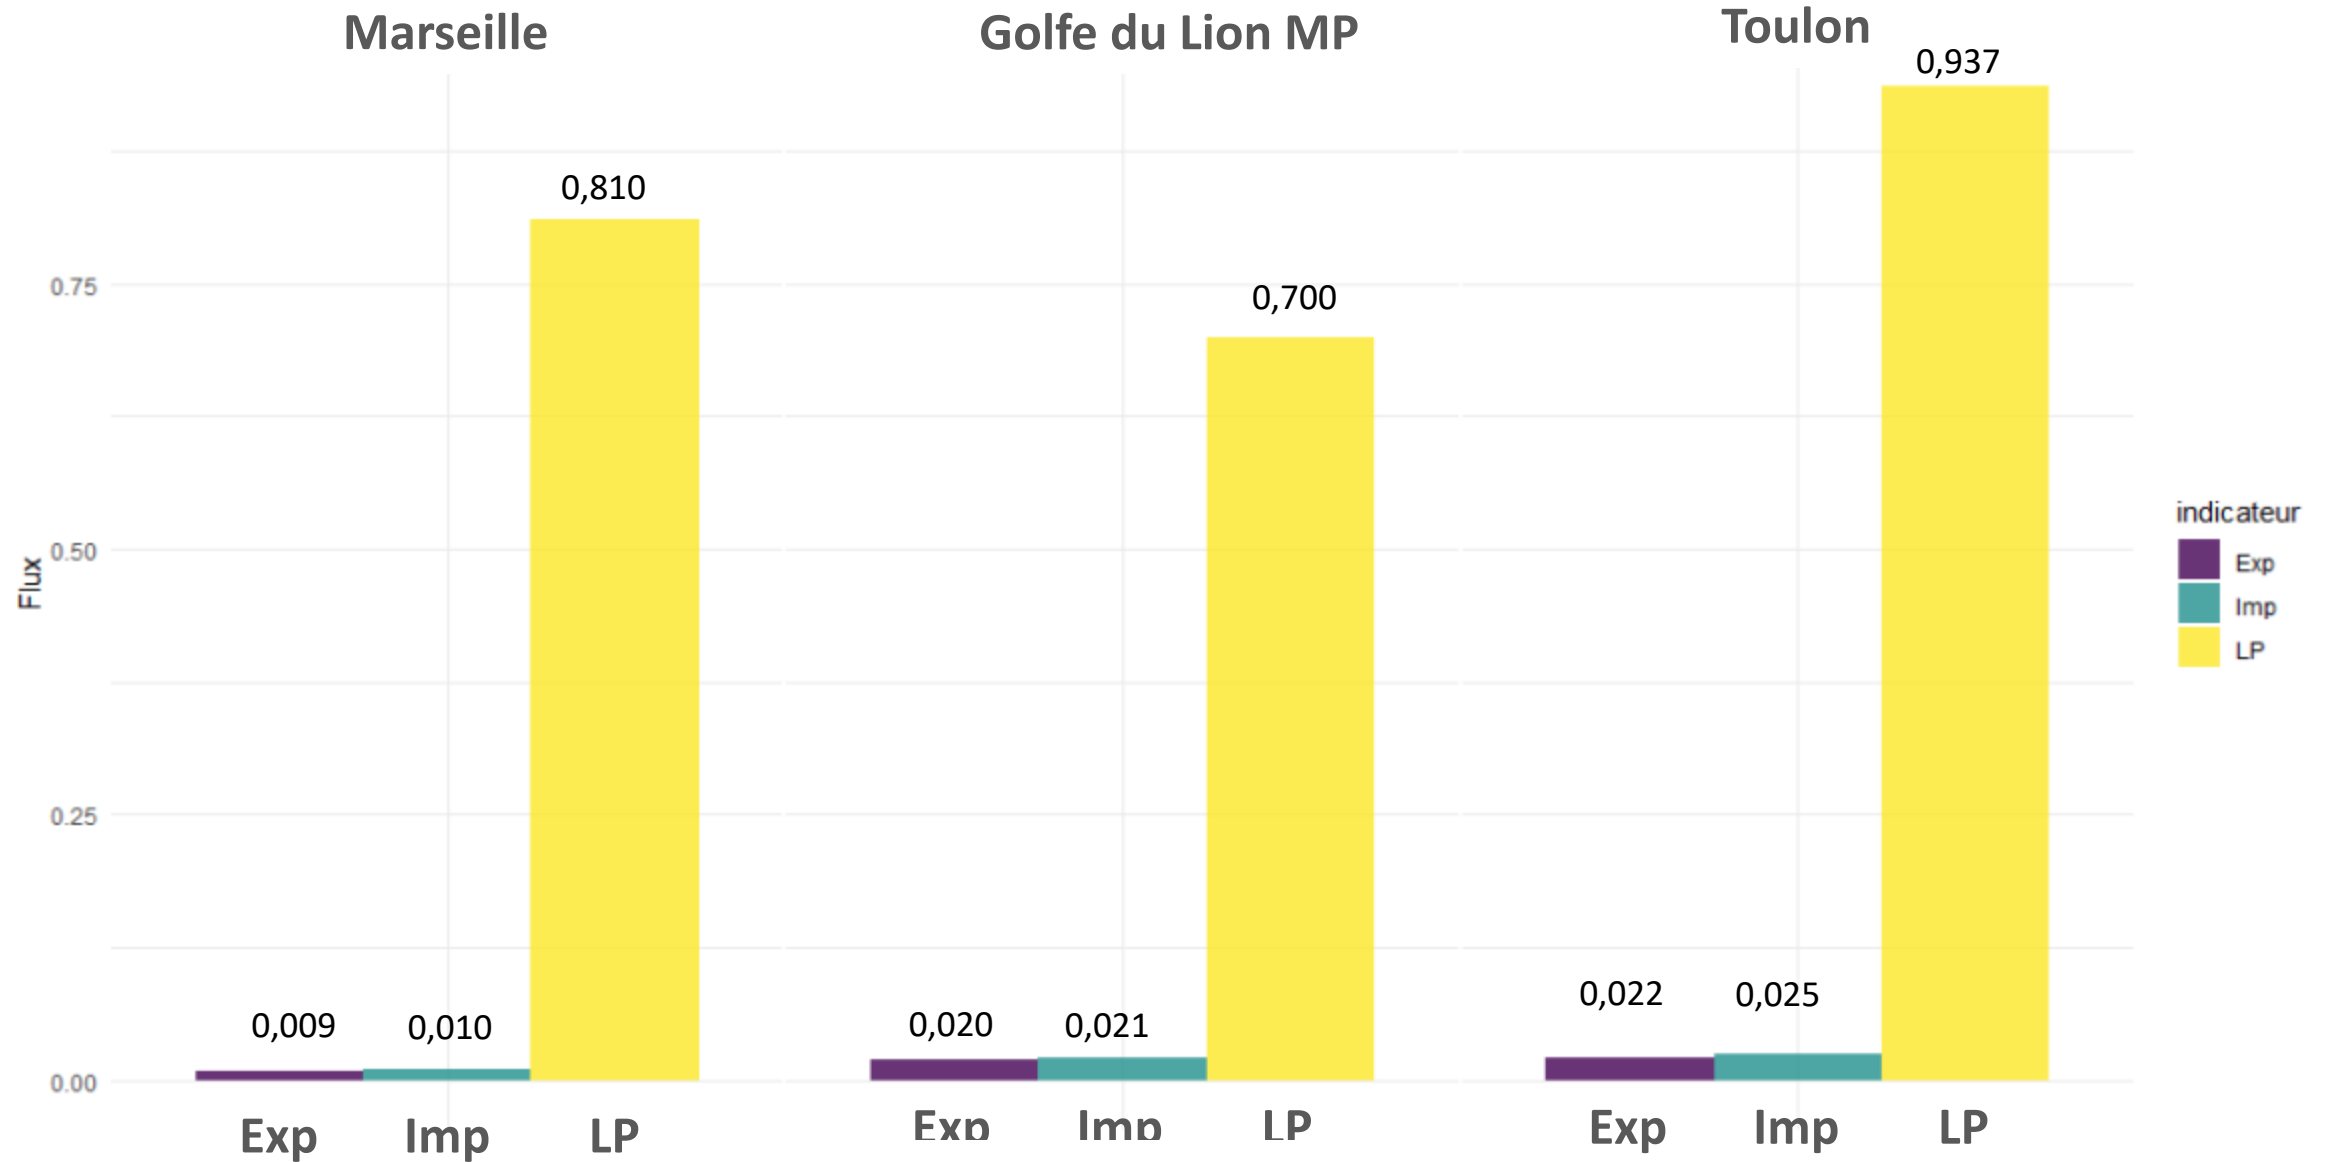

Number of particle
arrived anywhere

Number of particle released in the
area that stay in the area

$$LP = \frac{\sum_{i,j \in Z_M} A_{i,j}^*}{\sum_{i \in Z_M} A_i}$$

Number of particle
released in the area

Restauration and management in Marseille

Restauration and management in Marseille

Strategy

- Determine spatial scale
- Build Marseille sub-model

Adult area

14 age group

Natural mortality (26%)

Fishing effort

- Professional fishing
- Recreational fishing

Variable abundance

Reproduction

Eggs

Eclosion

Larvae

Mortality (99%)

Dispersal

Connectivity matrix

Nursery area

Natural (~ 56 km)

Mortality (80%)

Port (~ 25 km)

Mortality (99%)

Restaured

Mortality (80%)

Conclusion

Increasing spatial complexity

Marseille

Golfe du Lion MP

Toulon

Question

Impact of **artificial nurseries** at the fish **populations level**?

Impact of **multi-level MPA networks** on a fish population?

Comparing impact of **artificial nurseries** with MPA networks in a wider area?

Processes

- Spatial model
- Population dynamic
- Recruitment

- Spatial model
- Multi-fleet
- Larval connectivity

- Spatial model
- Multi-fleet
- Larval connectivity
- Recruitment

Data

- No fine scale pop data

- Spatial model
- Multi-fleet
- Larval connectivity

- Spatial model
- Multi-fleet
- Larval connectivity

Conclusion

- Spatially implicit strategy
- Limits: uniform adult and fishing effort distribution, no larval dispersal

- Spatially explicit strategy
- Resolution driven by available data
- Limits: uniform fishing effort

- Spatial implicit and explicit (different strategy for different process)
- Hyp: 2 independent sub models

THANK YOU FOR YOUR ATTENTION
